

## Mobile SMS Bulk Sender

A Dintillion.com product

First of all, thank you for using this Dintillion product! We hope you enjoy using it. This product has been designed with ease of use in mind, because operating a program should come naturally. If you do want some instructions, please read on. Otherwise, dive right in!

### Installation

The program is delivered in a .CAB format. You can install this using Active Sync or using the new Windows Mobile Device Center.

- 1) Copy the .CAB to your device.
- 2) Find the .CAB on your device and tap it with your stylus. Follow the instructions.
- 3) After installation is complete you may remove the .CAB file from the device to save space.

### Usage

- 1) To send messages using the Bulk Sender, you first need a file in the following format:

--FILE BEGIN--

<phone number>;<message>

<phone number 2>;<message 2>

--FILE END--

**TIP:** You can easily create these files using Word Mobile, which is by default installed on your Windows Mobile device. Just enter the phone number, add a semi-colon and enter the message after that.

Just make sure to save as a text file.

- Make sure every phone number starts on a new line.
- Use no brackets, dashes or hyphens in the phone number, just the numbers of the phone number.

- Every message can be different. This enables the program to be used for sending grades to pupils, for instance:

---Example---

012345678;Hello dear friend, just trying out my new SMS Bulk Sender, it seems great!

023456789;Hi Jim, this message is to let you know you passed your exam with flying colours, congratulations!

---End of example---

- 2) After you sync this file to your mobile device storage, you load the program.
- 3) Then, browse for the file, and it will load, showing you how many lines of the loaded file were detected as being valid messaging lines. (Meaning, having the correct format).
- 4) Now, the only step left is to press "Start" and the program will start sending.
- 5) After the run has been completed, a complete log file is available in the application folder. (Under My Device>Program Files>SMS Bulk Sender Dintillion)

You can use this to check whether all messages were sent properly.

### Troubleshooting & tips

- Should the program be aborted in mid-run (for example, a very long run that has to be interrupted), you can always continue the run by looking in the log file, seeing what the last successfully sent message was, deleting those lines in the file, and re-running the file.
- If you find at the end of a run that not all messages were sent (the program will retry 3 times, but continue after this, to make sure the other messages get sent properly), please delete all lines but the failed ones from the message file, and rerun this file.
- Make sure the file that you load contains only messages in the required format. Otherwise, unexpected errors may result.

### Registration

If you decide you like this product, please consider registering it. This will have the benefit of removing the advertisement that is added to each message. You can purchase a registration code from [www.dintillion.com](http://www.dintillion.com).

If you find a certain feature lacking from the program, please contact us via [www.dintillion.com](http://www.dintillion.com). We would gladly work with you to add new features to would make this software better!

## Contact
